

The Science Guy Part Two: Use Science to Believe

One day I went from there is no God to there is a God. Scientifically (alone in my room) that was near impossible. Who changed me? What influenced me? What science persuaded me? The only fact I know is that Dr. Laura told me on a tape that I need spirituality. From that moment on I was willing to test if God was real. That was it folks. No group, church, or book did it. I decided (in that moment) to investigate. I am not a scientist. Yet, I believe that many people think they are. So, test me Mr. science person. Why did a God mocker become a God lover alone in his room in the blink of an eye?

You got it all wrong! You love science or you're a scientist. Are you really either one of these? A scientist creates experiments to test theories. I suppose they may even test facts. Quantum physics is a relatively new science. Darwin did not know what a Quark was or is! Do Quarks exist? What I love is the challenge of trying. There are signs. Some very smart physicists believe Quarks do indeed exist. They are spending a tremendous amount of time and money to find the (once) unfindable. Scientist never stop trying to find answers and debunk theories. Their never satisfied with rumors.

A scientist turns things over. They reach beyond normal ideas. Science makes a flat world round. A horse world into a car world. A bird world into a plane world. On earth, clearly the landscape looks flat. Yet, the planets in the sky look round. The moon and sun look round. We can't see gravity, yet we can see the effects of gravity. A swing or a graviton ride at a fair prove gravity. Descartes said "I think, therefore I am." Are you? Do we really exist or are we a

thought in the mind of a flea on a pig? If you're a science person then test yourself. What facts make you who you are?

How many of your science enthusiasts can describe quantum physics?" Can you decipher $E=Mc^2$? The problem is in your mind. You believe there is no God. You believe the Bible is just a book. You say that science proves it. Yet, you have no tests, no formulas, and no facts. You just believe it. In fact, you believe you're a science lover but in reality, you treat everything as an insult to science. As a science guy or gal shouldn't you desire to understand? To experiment? To turn God over and dissect him? Yet, that's not how we roll is it? We have constructed a belief in our head that there is no God. We have also constructed (in our head) that science proves it. Yet, in your visible hand is no proof, facts, or proven experiments to substantiate your beliefs. You just believe it.

To be fair, the Christian does the same thing. Many don't read their Bible, go to church, or pray to God. Yet, they say they believe. Years ago, in school, I was sitting in a social studies class. The speaker was talking about who is homeless. I had a preconceived notion that most of the homeless are lazy bums. Yet, she pulled out the facts. Most homeless are mentally challenged people. Some are handicapped. By far the stats claim that most homeless people are not lazy bums but the misfortunate and shunned within society. That day I changed.

The professor challenged us to break down our beliefs. What do we really think about the homeless? About God or science. The horrifying answer is that "we think, therefore, we know." Know what exactly? That there is no God. That the world is round. That quarks exist. Yet, in reality we have no clue. We have not given one minute to study, experiment, or search for truth. We just believe what we think we know. In the mirror, it's time that you do a science test on yourself. Write down all the work and facts that you have compiled about the things you believe

are true. Once you see it on paper, you will realize that you believe because you want to. You're not really a science lover or scientist at all. You just thought you were. Instead, you believe a great many things without a shred of concrete facts at all.

My wife is a medical woman. Medical shows and careers fascinate her. Is she a doctor or nurse? Does she work in a hospital? No, but she does work in the medical field. Can a person with a broken wrist come to her for help? She is a medical person not a doctor. Doctor Who is called "The Doctor." Yet, by his own admission, he is called "The Doctor" but is not a doctor. How can we call ourselves science lovers if we don't do science stuff? What do you really know? What can you really prove? Admit it, the Big Bang Theory is fact to you, yet the leading scientists call it a theory. What you believe as fact is actually not proven.

The harsh reality for me that day in social class was the difference between facts, rumors and what I believed. I had to admit I believed homeless people were lazy bums. I was faced with the facts. It was either believe me or believe that facts. Gossip wants you to believe rumors. Fake news sites want you to believe them. Most of us don't believe politicians are truthful. Yet, we vote for a person because they are believable. What if the truth lays in between the spiritual and the physical? In our world they appear to co-exist. A creature has a gut feeling, intuition, and premonitions. I know you have. Your own person has a connection between the seen and unseen.

Ok, Mr. or Mrs. scientist, will you listen to why I believe in God and the Bible? Just hear me out! If anything, you will know more about the Christian world. You're reasoning for believing there is a God or not will be stronger. At least listen and turn me over in your mind. I'm not going to say the "magic words" to turn you into a psychotic Bible thumper. I have no persuasive ideas like a cult. Just my own reasons I believe. Are you willing to test my theories as a science lover?
